

Eurostyle Terminal Blocks Focus Product Stock List

Introduction

In an ongoing effort to better serve the Industrial Machinery, Commercial, and HVAC markets, Tyco Electronics is pleased to present the creation of the “Eurostyle Terminal Blocks Focus Products List”.

This Focus Products list is comprised of product lines which are regularly stocked in both sample and production quantities. This supplement is not representative of the entire Tyco Electronics Eurostyle offering. Additional position sizes, pin spacings, product solutions and information can be found at <http://www.tycoelectronics.com/industrial/>.

The intent of this catalog supplement is to provide some focus on the most commonly used products and position sizes. Included are product technologies such as Rising Cage Clamp, Wire Protector, Spring Cage, and IDC (Pivot Block). These technologies are suitable as solutions for common applications such as high density requirements, standard signal requirements, and high power applications.

TECHNOLOGY OVERVIEW

Rising Cage Clamp

- Intended for use in industrial applications such as instrumentation, industrial controls, data acquisition, and industrial communications products
- Available in single piece PCB mount, or two piece pluggable configurations
- Contacts are supplied wire ready and with captive screws for convenience

Wire termination is accomplished by first inserting a bare conductor into the wire entry area. Using a screwdriver, turn the screw in a clockwise direction, the applied torque causes the wire cage, or floor, to rise. The conductor is held firmly in place between the floor of the cage and the wire contact. To remove the conductor, simply rotate the screw in a counter clockwise direction to lower the wire cage and free the wire.

Wire Protector

- Intended for use in lighter duty or commercial applications such as security and alarm, or HVAC controls
- Available in single piece PCB mount, or two piece pluggable configurations
- The wire protector prevents the screw from damaging the conductor and/or wire strands

Wire termination is accomplished by first inserting a bare conductor into the wire entry area. Using a screwdriver, turn the screw in a clockwise direction, the applied torque causes the screw to lower itself within the plastic housing. The lowering of the screw causes the wire protector to compress down and traps the conductor between the wire protector and the bottom of the wire cage. To remove the conductor, simply rotate the screw in a counter clockwise direction to lower the wire.

Eurostyle Terminal Blocks

TECHNOLOGY OVERVIEW

Spring Cage

- Intended for use in industrial and commercial applications such as instrumentation, industrial controls, data acquisition, security & alarm, and HVAC controls
- Currently available in single piece PCB mount version
- Provides for faster wire termination than screw versions without sacrificing wire termination quality

Top wire entry versions are actuated with a finger or screwdriver. A lever is used to open the spring so that a wire may be inserted. First depress and hold the lever down, then insert a conductor into the wire entry area and release the lever. An internal spring retains the wire in the housing.

Side wire entry versions come in wire ready position. Insert conductor into the wire entry area and depress the lever with your finger. The lever activates an internal spring which retains the wire in the housing. To remove the conductor simply lift the lever wire is released.

Insulation Displacement

- Intended for use in industrial communications and control applications such as analog or serial communications using 22-24 AWG wires and sensor wiring
- Available in two piece pluggable configurations
- Provides for very fast and easy field terminations of small gauge wires and eliminates the need to strip wires

Wire termination is accomplished by inserting an un-stripped conductor into the wire entry hole located on the stuffer. Insert the wire all the way until it bottoms. The clear wire stuffer allows for visual confirmation. Depress the stuffer down onto the contacts with your finger until it latches onto the housing. Screwdrivers may be used in the primary slot to aid in seating the stuffer, but are not required.
